

## TESTING

Some tests for an imaginary TIMS would include integration tests for the the **legacy financial systems** already in place at SRC. There should be a tightly coupled integration if not identical already. Tests would check for the validity of data being entered from the new system to the legacy one, and the same on the receiving end.

Another test suite would include the access to student records from various devices and locations using the proper test credentials. Data integrity should also be tested at this time as well.
